Protectosil® BHN

Water repellent impregnation for concrete, clinker masonry, and ceramic tiles. Protection of mineral surfaces against the ingress of water and water soluble pollutants.

Water repellent impregnation for concrete, clinker masonry, and ceramic tiles. Protection of mineral surfaces against the ingress of water and water soluble pollutants.

Safety and Handling

Before considering the use of Protectosil® products please read its Safety Data sheet (SDS) thoroughly for safety and toxicological data as well as for information on proper transportation, storage and use. The Safety Data Sheet is available on our website www.protectosil.com or upon request from your local representative, customer service or from Evonik Resource Efficiency GmbH, Product Safety Department, E-MAIL sds-hu@evonik.com.

Packaging and Storage

Protectosil® BHN is supplied in 25 l, 200 l as well as in 900 l container. Protectosil® BHN should not come into contact with moisture. The material should be stored at temperatures between -10 °C und 40 °C. Protectosil® BHN has a shelf life of at least 12 months when stored in originally sealed containers.
Properties and Use

- clear, colorless, frost resistant liquid based on a monomeric alkyltrialkoxysilane
- solvent free, > 98% active ingredient
- flash point 63 °C
- low volatility
- not miscible with water
- viscosity (20° C) < 2 mPa.s

Protectosil® BHN

- is specially suited for the waterrepellent impregnation of mineral construction materials in outdoor areas
- is highly reactive and resistant against alkaline environment
- reaches very high penetration depth
- generates water vapour permeable, colorless impregnation
- reduces significantly the uptake of water and soluble salts (e.g. chlorides)
- protects hairline cracks of up to 0.3 mm
- is supplied ready to use
- is also recommended as waterproofing under coatings or other surface protection treatments
- conforms to TL/TP OS-A of ZTV SIB 90 standards set by the German Federal Transportation Ministry and to the EN 1504-2.
- can be used according to principles 1, 2, 5, and 6 of EN 1504-9

Protectosil® BHN is not intended for below grade waterproofing.

Application Details

Processing

Protectosil® BHN is suitable for the waterproofing of mineral substrates, in particular low-porosity substrates. In most applications Protectosil® BHN has to be used undiluted. The amount to be applied depends to a large extent on how absorbent the substrate is.

For best results, a curing time of 28 days should be allowed for fresh concrete before Protectosil® BHN is applied. Protectosil® BHN can also be used on old or carbonated concrete. Protectosil® BHN should be cured for 5 days before an additional surface protection treatment such as Protectosil ANTIGRAFFITI® or Protectosil® SC CONCENTRATE is applied. If the second system has to be applied sooner a test patch should be done first.

The substrates to be treated should be air-dry and clean in order to ensure deep penetration of the active ingredient. Acceptable surface cleaning methods include sandblasting, water blasting and chemical cleaners. During application the outside temperature and the temperature of the substrate should be within the range of 0 °C to 40 °C. Protectosil® BHN should not come into contact with water before or during application and should not be applied if there is strong wind or if it is raining.

Protectosil® BHN must be applied by flowcoating to the saturation point. This is achieved by allowing it to flow without pressure against the surface to be treated. All delivery devices for liquids are suitable (airless sprayguns, for example). The material must not be atomized or applied with a brush.

A liquid film of Protectosil® BHN must remain in contact with the substrate for several seconds. Horizontal surfaces should have a shiny, wet appearance for 3-5 seconds. Vertical surfaces should exhibit a 30-50 cm shiny curtain of liquid. All equipment and containers must be clean and dry. After use they can be cleaned with any organic solvent (methylated spirit, petrol or thinners).

Non-absorbent substrates such as, for example, glass, wood, plastic, and metal cannot be treated with Protectosil® BHN. Glass, wood, and metal are not attacked by Protectosil® BHN. Neither are most plastics used in construction. Therefore covering is normally not necessary. To make sure we recommend to carry out a test. In the worst case, product not absorbed by the substrate may react with atmospheric moisture to form a greasy, glossy silicone resin film, which can easily be removed if cleaned immediately using conventional cleaning agents or alcohol (check for compatibility of the solvent with the surface). Plants in the vicinity of the substrate to be treated should be protected against contact with Protectosil® BHN. In addition Protectosil® BHN should not come into contact with asphalt as it would dissolve.

Protectosil® BHN reacts with the interfaces in pores and capillaries of the mineral surface and forms invisible, water-repellent interfacial compounds. To determine the exact amount to be applied and to check weather previous or following treatments are compatible with the Protectosil® BHN treatment it is recommended to do a small test patch first.
